Nadine, a hyper-realistic humanoid coming from Singapore

The Japanese are undoubtedly the greatest lovers of ultra-realistic Humanoids, but researchers are not alone in working on this type of robots. Professor Nadia Thalmann of the Nanyang Technological University (NTU Singapore) develops Nadine, a home of a new robot type. It is able to recognize his interlocutors and has capable AI, according to its designers, to express personality, feelings.

The purpose of such a machine coupled with this decidedly realistic appearance is to be a "social robot", a robot designed to interact with humans.
