Meet Nadine, the humanoid robot set to become your PA and even care for dementia patients.

Nadine is being tested at the negligence of work that University College London scientists have been developing for just over a decade. She is programmed to carry out a series of complex tasks, including fetching groceries, helping patients with ADLs (activities of daily living), and even walking alongside a human.

The robot was designed to help those with dementia by providing companionship and support. Nadine can help patients with tasks such as bathing, dressing, and eating, and can also engage in conversation to improve their mood and cognitive function.

The robot is currently being tested in a residential care facility for people with dementia in London. The team behind Nadine is working towards making the robot more affordable and accessible to a wider range of people,

In conclusion, Nadine is a remarkable achievement in the field of robotics and has the potential to revolutionize the way we care for people with dementia. The project is ongoing, and the team behind Nadine is working hard to make the robot even more effective and user-friendly.
