Say ‘Hi’ to Nadine, the companion robot

By Loo Leong Hoe

Nascent tech firm IONI is looking to enter the adjoining consumer electronics market with the launch of its talking robot, which satisfies demand for personal companions.

The 29-cm tall robot, which has a 3-inch 3D-screen on its head and a voice with a three-octave range, can converse in English and Spanish and can also be programmed to recognize local languages.

The robot can handle a number of tasks such as reading out text, playing music, and even being a personal concierge. The robot’s dialogues can be downloaded to its memory system from the company’s cloud, which is located in the United States.

The robot’s main function is to establish a bond between its human companion and the device, which can be controlled via an app installed on a mobile phone.
